

- 1) Login Page
  - Verify Credentials
  - Based on Employee ID, the system will recognize the Employee, Manager or HR
- 2) Employee Login
  - View Work Schedule
  - Pay Stub
  - Request Time Off
  - Upcoming Announcements
  - Create Complaints
- 3) Manager Login
  - Over View Schedule
  - View and Approve/Deny Time Off
  - Create announcements
- 4) HR Login
  - Payroll Report
  - Complaint Report
  
  - Edit Employee Raises
  
  - CRUD New employees

User Scenario: We are creating a Job Management System. A user will log into the system, and the system will recognize the user based on employee ID. Based on ID, they will have a different system/access. If its an employee, they can see the following **Section 2**. Managers and HR will differ as shown above. Depending on access, some of the features are the ability to view your schedule, check your pay stub history, and request time off. Managers can edit schedules, and approve time off, while HR can view reports, handle raises, Complaints and have the authority to create new hires and terminations.

This System is designed to have common functions an employer would need for an employee to know his shifts, and gather documents as needed. It would provide Managers the ability to have operations/schedules run smoothly while giving HR the ability to see reports and handle HR responsibilities.
